Chapter 1

SYNOPSIS

```
#include <atmi.h>
```

```
void tpfreectxt(TPCONTEXT_T context);
```

Chapter 2

DESCRIPTION

Function frees up the context data which was returned by **tpgetctxt(3)** function call. Function does not do the **tpterm(3)**. Thus to remove context data fully, firstly thread running with context must call **tpterm(3)**, then **tpgetctxt(3)** and then call **tpfreectxt()**.

This function uses underlying thread local storage infrastructure which is provided separately for each of the major Enduro/X libraries - libnstd (Standard library), libufb (UBF buffer library) and libatmi (ATMI library). If operations at library levels are required, then following functions can be used:

1. `ndrx_nstd_tls_new()`, `ndrx_ufb_tls_new()`, `ndrx_atmi_tls_new()` - allocate TLS data for library.
2. `ndrx_nstd_tls_get()`, `ndrx_ufb_tls_get()`, `ndrx_atmi_tls_get()` - get the TLS data for library (currently associated with thread).
3. `ndrx_nstd_tls_set()`, `ndrx_ufb_tls_set()`, `ndrx_atmi_tls_set()` - set the thread local data from saved pointer.
4. `ndrx_nstd_tls_free()`, `ndrx_ufb_tls_free()`, `ndrx_atmi_tls_free()` - free the thread local data.

Function call run in NULL context. If current TLS context equals to *context* then current thread is set to NULL context.

Chapter 3

RETURN VALUE

N/A

Chapter 4

ERRORS

N/A

Chapter 5

EXAMPLE

See `atmitest/test016_contextsw/atmict16.c` for sample code.

Chapter 6

BUGS

Report bugs to support@mavimax.com
