Chapter 1

SYNOPSIS

tpbrdcstsv

Chapter 2

DESCRIPTION

This is special ATMI system process which is started in standard way by *ndrxrd* process application server boot. The server process is used for remote cluster node notification and broadcast dispatching in local application domain. When remote machine issues **tpnotify(3)** or **tpbroadcast(3)** command and the notification is delivered to local machine, the notification firstly is sent to **tpbrdctsv**. Then **tpbrdctsv**, service *TPBROADNNN* (where NNN - is local cluster node id) dispatches the notification/broadcast to the local app domain. Multiple copies of the server process can be started, in order to load balance the notification dispatching.
