Chapter 1

SYNOPSIS

```
#include <atmi.h>
```

```
int tpjsontoubf(UBFH *p_ub, char *buffer);
```

For XATMI client link with *-latmiclt -latmi -lubf -lnstd -lpthread -lrt -lm*

For XATMI server link with *-latmisrvl -latmisrvnomainl -latmisrvinteg -latmi -lubf -lnstd -lpthread -lrt -lm*

Chapter 2

DESCRIPTION

Function converts JSON formatted text in *buffer* to UBF buffer. JSON should be formatted in single level. Where JSON field name matches UBF field name. If multiple occurrences/array of values is present in JSON, then it is converted as multiple field occurrences in UBF buffer.

For example following JSON buffer:

```
{
  "T_SHORT_FLD":1765,
  "T_LONG_FLD":[
    3333111,
    2
  ],
  "T_CHAR_FLD":"A",
  "T_FLOAT_FLD":1.330000,
  "T_DOUBLE_FLD":[
    1111.220000,
    333,
    444
  ],
  "T_STRING_FLD":"HELLO WORLD",
  "T_CARRAY_FLD":"AAECA0hFTE×PIEJJTkFSWQQFAA=="
}
```

Will be converted to following UBF buffer:

T_SHORT_FLD	1765
T_LONG_FLD	3333111
T_LONG_FLD	2
T_CHAR_FLD	A
T_FLOAT_FLD	1.33000
T_DOUBLE_FLD	1111.220000
T_DOUBLE_FLD	333.000000
T_DOUBLE_FLD	444.000000
T_STRING_FLD	HELLO WORLD
T_CARRAY_FLD	\00\01\02\03HELLO BINARY\04\05\00

Note that **BFLD_CARRAY** (binary data) fields should be present in base64 encoding in JSON buffer. It is up to user to allocate UBF buffer with enough size to fit the converted message.

Chapter 3

RETURN VALUE

On success, **tpcall()** return zero; on error, -1 is returned.

Chapter 4

ERRORS

No error codes available for this function. Additional info might be read in **ndrx/ubf** logs, see **ndrxdebug.conf(5)**

Chapter 5

EXAMPLE

See `atmitest/test024_json/atmict24.c` for sample code.

Chapter 6
