## Chapter 1

# SYNOPSIS

```
#include <atmi.h>
```

```
void ndrx_atfork_prepare(void);
```

For XATMI client link with *-latmiclt -latmi -lubf -lnstd -lpthread -lrt -lm*

For XATMI server link with *-latmisrvl -latmisrvnomainl -latmisrvinteg -latmi -lubf -lnstd -lpthread -lrt -lm*

## Chapter 2

# DESCRIPTION

When process is about to copy it self (i.e. perform forking in UNIX terms), Enduro/X requires certain tasks to be performed before this action. Particularly, if System V IPC transport is used by Enduro/X, then auxiliary threads shall be terminated and contexts released. Thus if doing manual **fork()**, then before this call, parent shall call **ndrx\_atfork\_prepare()** procedure. Procedure can be registered with **pthread\_atfork()**, passing it to *prepare* argument.

At given time function does some logic by System V IPC, for other IPC no logic is executed. But this fact is subject of change, and in future releases some other tasks might be required to be one by Enduro/X before process forking, thus it is recommended to use **ndrx\_fork()**, call manually **ndrx\_atfork\_prepare()** or register it with **pthread\_atfork()**
